Interpretation Notes:-

A complete blood count gives information regarding the cell types in person's blood and concentration of haemoglobin. Cells that circulate in the blood are generally divided into three types: RBC, WBC and platelets. Abnormally high or low counts may occur in physiological conditions and in diseased states and requires clinical correlation. Differential counts and RBC indices help in further understanding of the likely aetiology.

NOTE: This report has been generated by a fully automated analyser after counting thousands of cells and hence differential count may appear as decimalized numbers.

Interpretation Notes:-

Kidney/Renal function tests (KFT/RFT) are usually ordered when a patient has risk factors for kidney dysfunction such as hypertension, diabetes, cardiovascular disease, obesity, elevated cholesterol or a family history of kidney disease. It may also be ordered when someone has signs and symptoms of kidney disease, though in early stage often no noticeable symptoms are observed. Kidney panel is useful for general health screening; screening patients at risk of developing kidney disease; management of patients with known kidney disease.
