Prostate Specific Antigen (Total)

Test Name	Observed Values	Units	Biological Reference Intervals
* PROSTATIC SPECIFIC ANTIGEN (PSA).	0.57	ng/mL	UPTO 4.0

Method : ECLIA

INTREPRATATION:

Raised Total PSA levels may indicate prostate cancer, benign prostate hypertatation (BPH), or inflammation of the prostate. Prostate manipulation by biopsy or rigorous physical activity may temporarily elevate PSA levels. The blood test should be done before surgery or six weeks after manipulation. The total PSA may be ordered at regular intervals during treatment of men who have been diagnosed with Prostate cancer and in prostatic cancer cases under observation.

Calcium

Test Name	Observed Values	Units	Biological Reference Intervals
* CALCIUM	9.56	mg/dL	8.8-10.62

Method: Arsenazo III Method

INTERPRETATION::

Calcium is one of the most important minerals in the body. Calcium needed for healthy bones and teeth. Calcium is also essential for proper functioning of the nerves, muscles, and heart.

Symptoms of high calcium levels include:

- Nausea and vomiting
- More frequent urination
- Increased thirst
- Constipation
- Abdominal pain
- Loss of appetite

Symptoms of low calcium levels include:

- Tingling in the lips, tongue, fingers, and feet
- Muscle cramps
- Muscle spasms
- Irregular heartbeat

Kidney Basic Screen

Test Name	Observed Values	Units	Biological Reference Intervals
* SERUM CREATININE Method:Enzymatic Method (sarcosine oxidase, Peroxidase)	0.69	mg/dL	0.6 - 1.4
* UREA Method:Urease UV	33.2	mg/dL	16.8-43.2
* UREA NITROGEN (BUN) Method:Calculated	15.51	mg/dL	8 - 23
* BUN/CREATININE RATIO	22.48		
* URIC ACID Method:Uricase-Peroxidase	4.82	mg/dL	Male:3.6 -8.2 Female:2.3 - 6.1
* SODIUM Method:ISE Direct	140	mmol/L	136-145
* POTASSIUM Method:ISE Direct	4.63	mmol/L	3.5 - 5.5
* CHLORIDE Method:ISE Direct	98.7	mmol/L	95-105

INTERPRETATION::

kidney disease usually does not have signs or symptoms. Testing is the only way to know how your kidneys are doing. It is important to get checked for kidney disease if an individual having the key risk factors - diabetes, high blood pressure, heart disease, or a family history of kidney failure.

Iron Deficiency Profile

Test Name	Observed Values	Units	Biological Reference Intervals
* IRON Method: Colorimetric Assay	137	µg/dL	Male: 45-158 Female: 37-145
* Total Iron Binding Capacity (TIBC) Method: Ferrozine	265.3	µg/dL	240 - 450
* TRANSFERRIN Method: Immunoturbidometry	180.48	ug/dl	176 - 280
* TRANSFERRIN SATURATION	51.64	%	20 - 50
* FERRITIN Method: Chemiluminescence	54.3	ng/mL	11.0 - 306.8

INTERPRETATION::

Iron is a mineral that's essential for making red blood cells. Red blood cells carry oxygen from the lungs to the rest of the body. Iron is also important for healthy muscles, bone marrow, and organ function. Iron levels that are too low or too high can cause serious health problems. Iron levels that are too low include Pale skin, Fatigue, Weakness, Dizziness, Shortness of breath, Rapid heartbeat. Iron levels that are too high include Joint pain, Abdominal pain, Lack of energy, Weight loss.

THYROID PANEL-I

Test Name	Observed Values	Units	Biological Reference Intervals
* TOTAL TRIIODOTHYRONINE (T3) Method:CLIA	0.73	ng/mL	0.58 - 1.62
* TOTAL THYROXINE (T4) Method:CLIA	5.82	ug/dl	5.0 - 14.5
* Thyroid Stimulating Hormone.(TSH) Method:CLIA	20.17	μIU/mL	0.35 – 5.1

INTREPRATATION:

The determination of T3 is utilized in the diagnosis of T3hyperthyroidism,the detection of early stages of hyperthyroidism and for indicating a diagnosis of thyrotoxicosis factitia.

The determination of T4 can be utilized for the following indications: the detection of hyperthyroidism, the detection of primary and secondary hypothyroidism, and the monitoring of TSH-suppression therapy.

The determination of TSH serves as the initial test in thyroid diagnostics.Even very slight changes in the concentrations of the free thyroid hormones bring about much greater opposite changes in the TSH level. Accordingly,TSH is a very sensitive and specific parameter for assessing thyroid function and is particularly suitable for early detection or exclusion of disorders in the central regulating circuit between the hypothalamus, pituitary and thyroid.

25-Hydroxy Vitamin D

Test Name	Observed Values	Units	Biological Reference Intervals
* 25-OH VITAMIN (VIT D3) Method:C L I A	19.3	ng/mL	Deficiency: <10 Insufficiency: 10-30 Sufficiency:30-100 Toxicity: >100

INTERPRETATION::

Vitamin D is a nutrient that is essential for healthy bones and teeth. There are two forms of vitamin D that are important for nutrition: vitamin D2 and vitamin D3. Vitamin D2 mainly comes from fortified foods like breakfast cereals, milk, and other dairy items. Vitamin D3 is made by your own body when you are exposed to sunlight. It is also found in some foods, including eggs and fatty fish, such as salmon, tuna, and mackerel.

Vitamin D deficiency is due to:

- Not getting enough exposure to sunlight
- Not getting enough vitamin D in your diet
- Having trouble absorbing vitamin D in your food

A low result may also observed due to body is having trouble using the vitamin as it should, and may indicate kidney or liver disease.

A vitamin D deficiency is usually treated with supplements and/or dietary changes.

Vitamin - B12

Test Name	Observed Values	Units	Biological Reference Intervals
* Vitamin - B12	367	pg/mL	180 - 916

Method:CLIA

INTREPRATATION:

Vitamin B12 and folate are critical to normal DNA synthesis, which in turn affects erythrocyte maturation.3 Vitamin B12 is also necessary for myelin sheath formation and maintenance. The body uses its B12 stores very economically, reabsorbing vitamin B12 from the ileum and returning it to the liver so that very little is excreted. Clinical and laboratory findings for B12 deficiency include neurological abnormalities, decreased serum B12 levels, and increased excretion of methylmalonic acid. The impaired DNA synthesis associated with vitamin B12 deficiency causes macrocytic anemias. These anemias are characterized by abnormal maturation of erythrocyte precursors in the bone marrow, which results in the presence of megaloblasts and in decreased erythrocyte survival. Pernicious anemia is a macrocytic anemia caused by vitamin B12 deficiency that is due to lack of intrinsic factor. Low vitamin B12 intake, gastrectomy, diseases of the small intestine, malabsorption, and trans-cobalamin deficiency can also cause vitamin B12 deficiency.

Glycosylated Hemoglobin (GHb/HbA1c)

Test Name	Observed Values	Units	Biological Reference Intervals
* GLYCOSYLATED HAEMOGLOBIN (HbA1C) Method:Enzymatic method	8.7	%	Non-diabetic: 4.8 - 5.9 % Pre-diabetic: 5.9 - 6.5 % Diabetic: >= 6.5 %
* Approximate mean plasma glucose Method:Calculated	202.99		<111

INTERPRETATION::

	HbA1C Value in %	Average Glucose in mg/dL	Impression
A hemoglobin A1c (HbA1c) test measures the amount of blood sugar (glucose) attached to hemoglobin. If HbA1c levels are high, it may be a sign of diabetes, a chronic condition that can cause serious health problems, including heart disease, kidney disease, and nerve damage. Note: The HbA1c test is not used for gestational diabetes, a type of diabetes that only affects pregnant women, or for diagnosing diabetes in children. References American Diabetes Association.
